- ✓ All plumbing works
- ✓ Landlord CPI2 inspections

# SENSOR BATHROOM PRODUCTS

Sensor products (also known as touch-less or infra-red) have seen a sharp increase in demand since the start of the pandemic.

As individuals we've become focused on ensuring that we maintain the most critical levels of hygiene, ensuring that we avoid the touching of germ hotspots such as taps, toilet flushes & dyers.

Previously you may have only experienced sensor based products in a select number of premises or venues, today customers increasingly expect them to be provided as part of a high quality bathroom or washroom environment.

## Reasons why you need sensor products in your bathroom

- ✓ Reduces the number of touch points
- ✓ Minimises germs spreading
- ✓ Improves staff or customer experience
- ✓ Reduces water wastage
- ✓ Modern appearance
- ✓ Cost savings

# TAPS & FLUSHES

## SENSOR TAPS

Sensor taps have rapidly become the go-to for many homeowners, businesses & public sector workspaces for their efficiency, ease of use and the fact that they help against the spreading of germs.

With the taps working intuitively, they are perfectly suited to today's modern world, and with users never having to physically touch them, sensor taps can significantly reduce the spread of bacteria in the wash space.

The controlled water flow means taps can't accidentally be left on, and generate huge water savings in their own right, especially when compared to traditionally operated taps.

## SENSOR TOILET FLUSHES

Motion sensor toilets are an increasingly popular type of toilet that automatically flushes when a sensor on the toilet senses that the user has departed.

In high volume bathrooms, toilets can be flushed up to 400 times per day. Since no handle is used, automatic flush toilets prevent germs from passing from one person to another.

Motion sensor toilets allow users the freedom of not having to worry about whether the toilet is flushed.

Due to their automatic flushing, motion sensor toilets ensure no waste will remain in the toilet..

# **DISPENSERS & DRYER**

## **SOAP DISPENSER**

Innovative and stylish soap dispenser units are the most efficient way to wash your hands in any bathroom environment.

The sensor operated, soap dispenser can control the amount of soap dispensed by positioning your hand. Users can request additional soap to be dispensed by moving their hand away and then relocating in front of the sensor once again.

It prevents the need to touch the dispenser and the potential of spreading germs or bacteria.

## **HAND DRYER**

In addition to the fact the dryer is sensor driven, meaning another area within your premises bathroom in which the spread of germs & bacteria can happen.

Sensor dryers provide both cost effective & safe solutions. Modern hand dryers provide short & sharp air solutions to dry the hands quickly reducing the amount of water around the area.

In bathroom environments in which paper or cloth based drying solutions are offered. You have a multitude of touch points in which possible germs or bacteria can spread if hygiene standards are not met.

Modern dryers provide a fresh feel to your bathroom area and provide both your staff and customers a better user experience.
